Software Engineer Full-Stack Systems / Product Engineering / Design Engineering

Software engineer building full-stack systems, product interfaces, and backend architecture across live streaming, fintech, and healthcare, with deep experience spanning Ruby on Rails, realtime media, design systems, and product engineering.

Experience

Wistia / Senior Software Engineer

Apr 2022 - Present

- Redesigned the event join flow by separating device setup from room initialization, simplifying browser-specific media handling while reducing unnecessary rendering and improving reliability before users entered an event.
- Built full-stack systems across Ruby on Rails, GraphQL, MySQL, React, TypeScript, HLS, and WebRTC while contributing to production reliability through on-call, mentoring, and cross-team technical planning.
- Led Wistia Live's Anonymous Q&A epic through external release, pushing back on product requirements and deliberately reducing scope to achieve a simpler architecture and a more coherent user experience.
- Helped deliver Wistia Live's migration from 100ms to LiveKit by building vendor-neutral abstractions, including a reusable audio-state layer, and resolving performance and device issues that were critical to the project's success.
- Joined Wistia's Live team at product inception, playing a key role in building and scaling a real-time webinar platform from prototypes into production, now supporting **600+ webinars** and attracting over **80,000 registrants** each month.
- Helped ship WebRTC stage viewing to audience members—previously limited to hosts and panelists—while adding issue reporting, audio-state handling, and responsive fullscreen layouts across desktop and mobile.
- Created Studio, a shared frontend platform that extended our design system with reusable components and product patterns for Live and Group Record, accelerating development and improving consistency.

Provide (acquired by Fifth Third) / Senior Software Engineer

May 2018 - Apr 2022

- Served as the team's frontend SME, leading the migration of a legacy application to Ember Octane while establishing the company's design system, shared UI platform, and long-term frontend architecture across Ember, React, and Rails.
- Designed and built an audit trail and versioning system that presented loan application changes as Git-style diffs, giving closing agents complete visibility into every revision while simplifying compliance and review workflows.
- Built full-stack systems across Ruby on Rails, PostgreSQL, Sidekiq, RSpec, Cypress, Elasticsearch, and third-party financial APIs including Experian and Equifax.

Provide (continued)

- Led the engineering implementation of the company's rebrand from Lendeavor to Provide, partnering with Product and executive leadership to transform the brand into a cohesive customer experience prior to its acquisition by Fifth Third.

Novillus / Software Engineer

Apr 2015 - May 2018

- Built and maintained five Ruby on Rails applications spanning customer-facing products, internal platforms, and shared Rails engines while establishing company-wide frontend standards.
- Designed a reusable Ruby on Rails engine for ETL workflows and domain-specific business logic, including a visual workflow builder using Vue, JointJS, and Ace Editor.
- Designed and developed a reusable Twilio-powered call-center platform as a Ruby gem used across multiple applications.
- Delivered the company's first web application, integrating Salesforce and third-party APIs for secure healthcare workflows.
- Established the company's first shared Vue component library and design system, creating reusable UI patterns adopted across multiple applications.

Skills

Languages & Frameworks

Ruby on Rails • Ruby • Hotwire • GraphQL • SQL • TypeScript • React • EmberJS

Data & Infrastructure

PostgreSQL • MySQL • Elasticsearch • Sidekiq • RSpec • Cypress • CI/CD • Observability

Product Engineering

Design Systems • Design Engineering • Performance • Accessibility • Structured AI Workflows
